

Yan Lukashevich

Full-stack Developer — .NET · React · Azure

yanlukashevich2@gmail.com · +48 793 233 209 · [GitHub](#) · [LinkedIn](#) · Polish C2 · English C1 · Russian C2

PROFESSIONAL PROFILE

Single-handedly designed, built, and deployed to production a commercial self-service printing system (.NET 8, React 19 / TypeScript, Microsoft Azure) — from architecture and code, through payment integration and CI/CD, to a network of physical IoT kiosks. As a one-person team, I defended the system in a month-long security audit by a public institution (UCI NCU), whose positive outcome was a precondition for deployment. Before that, I spent two years developing scientific software in Python at NCU (a computational library for a research group, automation of calculations on an HPC cluster).

TECH STACK

- **Backend:** C#, ASP.NET Core 8, Entity Framework Core, REST API, WebSocket · Node.js, NestJS
- **Frontend:** React 19, TypeScript, JavaScript, Vite, Tailwind CSS, i18n, accessibility (a11y)
- **Cloud / DevOps:** Microsoft Azure (App Service, SQL Database, Service Bus, Blob Storage, Key Vault, Virtual Network, Managed Identity, Application Insights), GitHub Actions (CI/CD, OIDC), Docker, Docker Compose
- **Databases:** Azure SQL, SQLite (Entity Framework Core), MongoDB
- **Security:** defense-in-depth, threat modeling, Managed Identity + Key Vault, GDPR (privacy by design)
- **Testing / processes:** TDD, integration testing (xUnit, Jest, pytest), Git / GitHub flow, code review, Scrum
- **Other:** Python (FastAPI, NumPy, pandas), Linux and networking (bash, Cisco CCNA), Raspberry Pi / IoT

WORK EXPERIENCE

DrukMruk — Founder & Lead Developer

Sole proprietorship · 02.2026 — present · [drukruk.pl](#)

- **From zero to production in 3 months, solo** — a commercial, distributed self-service printing system for the academic community: a web app (React 19 / TypeScript), a cloud backend (ASP.NET Core 8, Azure), and a network of physical IoT kiosks (Raspberry Pi).
- Implemented a **fault-tolerant payment integration (Autopay)** — transaction initiation, cryptographically verified webhooks, and automatic refunds, with guaranteed state consistency between payment and print; critical flows covered by tests (TDD).
- Passed a **month-long security audit by a public institution (UCI NCU)** — over several rounds with the university's security team, I defended the architecture and hardened the system (network isolation of the tiers, data protection, centralized logging and incident alerting); a positive assessment was a precondition for deployment.
- Built and maintain the entire cloud infrastructure and CI/CD — Azure (App Service, SQL, Service Bus, Key Vault, VNet, Managed Identity, Application Insights), GitHub Actions with OIDC federation — without a separate DevOps team.
- Designed autonomous printing kiosks that run unattended in public spaces — Raspberry Pi 5 with a touchscreen and a local agent (FastAPI), a dedicated LTE connection, the device hardened in layers against the real-world threat model of a public location.
- Won **Copernicus Startup Stars 2026** and secured official university approval to deploy the kiosks — despite initial refusals, I carried the project through negotiations with NCU authorities, technical documentation, and the full formal / legal path.

Nicolaus Copernicus University in Toruń — Scientific programmer (quantum chemistry)

Contract · 02.2024 — 03.2026

- Designed and wrote a **Python computational library** used by the entire research group — a modular architecture that speeds up calculations relative to methods of the same accuracy class; being prepared for open-source publication.
- Automated the computational cycle on the HPC cluster, cutting a batch of calculations **from ~a day to an hour** — scripts for job queuing and resource monitoring (Linux, PBS, conda).
- Verified the method's correctness against the scientific literature and reference data — numerical analysis (NumPy), visualizations, and comparisons for an upcoming publication.

PROJECTS

Ventilator simulator — Team leader

2026 · [github.com/yanlukashevich/Respirator-simulator](#)

- Led a 4-person team to **1st place in the NCU Institute of Physics competition** and to laureate status in the university-wide competition — a distributed, real-time ventilator simulator; the project is entering commercialization as an **NCU spin-off company**.
- Owned the architecture and integration of the whole system — translated medical requirements into a specification; physical patient stations (Raspberry Pi) and a trainer's panel; integrated components from different authors (Node.js / NestJS, WebSocket, React).
- Designed a network that scales the system **from 2 to 15 stations** — built from scratch (Linux, AP / DHCP / DNS / NAT / SSH), ready to run in a training room.

EDUCATION

- **Applied Computer Science**, B.Eng. engineering studies — Nicolaus Copernicus University in Toruń, 2022–2026
